~ The number of drill rigs? ~

To NuLegacy shareholders/stakeholders:

Good day folks,

It's been drawn to our attention there is a frequently asked question about our upcoming spring 2021 drill program regarding the number of rigs we will be using. We could not answer it better than a recent post about NuLegacy by the commentator **@lexcon** at <https://ceo.ca/nug>:

"... there is a lot of talk about the 5 rigs they [NuLegacy] are bringing in, as if they will all be drilling at the same time in 5 different locations.

...that isn't exactly the case. Reading the NR [[NR February 9, 2021](#)] that came out announcing the drill program a little while back, they are targeting deep targets.

But to get to those they need to pass thru a known overburden cap that is significantly thick. It takes time to drill deep using cored diamond drills. In order to speed up the process, the NR explained that they will be employing two high capacity RC rigs¹. These will be used to basically drill like hell thru the cap.

They won't be collecting core samples², and likely won't even assay the ground up output of the drills. The whole reason for them is to bore a large diameter hole thru the upper 1000 ft of rock [and casing them so there's no 'rock fall'].

Then, the other three drills will start drilling diamond drill core drilling starting at the 1000+/- ft depth down to the target much deeper, in those collars established by the RC drills.

¹ And it's been determined that one RC rig 'double shifting' [as will be the case with the diamond drill rigs] will be more effective than two rigs single shifting.

² Actually, we will be collecting samples of the 'chips' that the reverse circulation (RC) rigs produce as they drill the hole to assay for the geochemistry.

So effectively, they will have 3 drill rigs actually producing cores for assay of the deposit, and 2 other RC rigs punching access holes thru the cap."

Thank you, @lexcon, for this great explanation!

Cheers,

Albert
